

ComPDF Conversion SDK for Android 4.1.0 Upgrade Warnings

This document contains a list of considerations that developers should be aware of when upgrading from previous versions to ComPDF Conversion SDK for Android 4.1.0. Changes in the code may be necessary to ensure compatibility with the new version for your project to compile properly.

Upgrading from version 4.0.0 to version 4.1.0

If you are upgrading from version 4.0.0 to version 4.1.0, please note the following additions. None of them break source compatibility — existing 4.0.0 code keeps compiling and behaves the same, because every new option keeps the previous behaviour as its default.

New conversion option: AI Table Recognition

The option classes used by formats that support Table Recognition, such as `wordOptions`, `ExcelOptions`, `PptOptions`, `HtmlOptions`, `RtfOptions`, `CsvOptions`, `JsonOptions`, and `MarkdownOptions`, now expose a new property:

```
val wordOptions = wordOptions()
wordOptions.enableAiTableRecognition = true // enabled by default in 4.1
```

This controls whether the AI Table Recognition stage runs on table regions detected by layout analysis. Set it to `false` to skip the table model entirely and rely on geometric reconstruction from the underlying page objects. The option only takes effect when layout analysis is active, i.e. `enableAiLayout = true`, or implicitly when `enableocr = true`. See the developer guide chapter *Table Recognition* for details.

Extended scope of the `fontName` option

In 4.0.0, `fontName` was honored for PDF to Word, PDF to Excel, and PDF to PowerPoint. In 4.1.0 it additionally applies to:

- PDF to Searchable PDF
- PDF to OFD

For Searchable PDF and OFD, `fontName` controls the font used for the text layer overlaid on the page background.
